Product based on a Deep Learning model (by fastai v2) ¶

Use case: Dog & Cat Breeds Recognizer for Veterinary Clinics

- Author: Pierre Guillou (Al Professor at the University of Brasilia (UnB) & Al Lab Associate Researcher in NLP)
- Date: 10/22/2020
- Post in Medium: Product based on a Deep Learning model (by fastai v2)
- Github folder of the Web App v1
- Version 1 of the Web App

Overview

This is the notebook of the post Product based on a Deep Learning model (by fastai v2).

Read this post to understand the context and objective of this notebook.

1. Initialization

```
In [1]: # Import fastai v2 for computer vision
    from fastai.vision.all import *
    from fastai.vision.widgets import *

In [2]: # Check for CUDA & GPU
    if torch.cuda.is_available():
        print(f'gpu: {torch.cuda.current_device()} ({torch.cuda.get_device_name()})')
    gpu: 0 (Tesla V100-PCIE-32GB)
```

2. Data

```
In [3]: # Get path to data
    path = untar_data(URLs.PETS)
    path.ls()

Out[3]: (#2) [Path('/mnt/home/pierre/.fastai/data/oxford-iiit-pet/annotations'), Path('/mnt/home/pierre/.fastai/data/oxford-ii
    it-pet/images')]

In [4]: # Check first image
```

Out[4]:

3. Dataloaders

We will define a <code>DataBlock()</code> object using all the recent techniques (see the notebook 07_sizing_and_tta.ipynb):

- Data Augmentation with the list of transforms at batch level (aug_transforms()).
- Presizing (notebook <u>05 pet breeds.ipynb</u>).

path_to_img = (path/'images').ls()[0]
img = PILImage.create(path_to_img)

- Normalization with the standard ImageNet mean and standard deviation (Normalize.from_stats(*imagenet_stats)).
- **Progressive Resizing**: Gradually using larger and larger images as you train (get_dls()).

```
In [6]: # Get Dataloaders
    dls = get_dls(128, 128)
In [7]: # Check number of categories and list
    dls.vocab
```

Out[7]: (#37) ['Abyssinian', 'Bengal', 'Birman', 'Bombay', 'British_Shorthair', 'Egyptian_Mau', 'Maine_Coon', 'Persian', 'Ragdoll', 'R ussian_Blue'...]

In [8]: # Batch size and Check images in training batch
dls.bs, dls.show_batch(nrows=1, ncols=3)

havanese

Out[8]: (128, None)

4. First model (baseline)

Let's train our model with the following fine-tuning techniques:

- gradual unfreezing of layers from the last ones to the first ones.
- Discriminative Learning Rates (notebook <u>05 pet breeds.ipynb</u>).
- Deeper Architectures: let's start with resnet34 as baseline, and then resnet152 as final model.

4.1 Images of size 128

In [9]: # Learner with model resnet34
dls = get_dls(128, 128)
model = resnet34 loss_func=LabelSmoothingCrossEntropy()

learn = cnn_learner(dls, model, loss_func=loss_func, metrics=[accuracy])

Freeze all layers but the last (new) ones

In [10]: # Check model and frozen layers learn.freeze()

learn.summary()

epoch train_loss valid_loss accuracy time

Out[1

          preds,targs = learn.tta()
          accuracy(preds, targs).item()
Out[74]: 0.9465494155883789
```

The accuracy did not improve. The thing to do to improve it is certainly to get more training data ... as always with Deep Learning models!

```
102 - train valid

1098 - 0.98 - 0.96 -
```

In [71]: # Display the training and validation loss

```
In [72]: # Save the model
    learn.save('petbreeds_9')
Out [72]: Path('models/petbreeds_9.pth')
```

0.94

8. Export best model

According to the accuracy, we keep our baseline model as the best one with a validation accuracy of 95.4%.

800

```
In [95]: # Export best model
learn = learn.load('petbreeds_4')
learn.export()
```

9. Turning your model into a Web App

Fonte: notebook <u>02_production.ipynb</u>

```
In [79]: # Get model for inference
learn_inf = load_learner('export.pkl')
```

Creating a notebook App from the model

```
In [80]: # Button to upload image
         btn upload = widgets.FileUpload()
         # Button to classify
         btn run = widgets.Button(description='Classify')
         # Display a thumb of the image
         out_pl = widgets.Output()
         out_pl.clear_output()
         # Calculation and display of the category prediction
         lbl_pred = widgets.Label()
         def on click classify(change):
             img = PILImage.create(btn upload.data[-1])
             out_pl.clear_output()
             with out pl: display(img.to_thumb(128,128))
             pred,pred_idx,probs = learn_inf.predict(img)
             lbl pred.value = f'Prediction: {pred}; Probability: {probs[pred idx]:.04f}'
         btn run.on click(on click classify)
In [81]: # Run app
         VBox([widgets.Label('Select your animal!'),
               btn_upload, btn_run, out_pl, lbl_pred])
```

Turning your notebook into a (real) Web App

fastai explains in the notebook <u>02_production.ipynb</u> how to create a Web App using your <u>export.pkl</u> file on a free Web service like <u>Binder + Voilà</u>. You can as well read and apply this <u>Guide on how to duplicate the fastai bear_voila app on Binder</u> (if you need help about git, read this <u>git - the simple guide</u>).

This is a great way for your first well-chosen users (parents or friends for example, or even a first client) to use your Web App, which will give you initial feedback and new data, which in turn will allow you to improve both your model and your Web App interface (this is *The Virtuous Cycle of AI* of Andrew Ng explained in the

Of course, this free service is not sufficient for a professional Web App that you are going to develop alongside this first version.

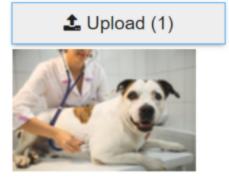

To do that, check the following paragraph for tips and have fun!

Version 1 of our "Dog & Cat Breeds Recognizer for Veterinary Clinics"

- Github: https://github.com/piegu/petsbreeds_voila
- Web App: https://mybinder.org/v2/gh/piegu/petsbreeds_voila/master?urlpath=%2Fvoila%2Frender%2Fpets_classifier.ipynb

Dog & Cat Breeds Recognizer for Veterinary Clinics

Select your pets!

Prediction: american_bulldog; Probability: 0.9039

10. Turning your Web App into a startup product

This paragraph is written in the post Product based on a Deep Learning model (by fastai v2).

End of the notebook but about our startup product: to be continued...
